EDUCATION

Bachelor of Technology - Computer Science and Engineering **Nov 2020 – July 2024**

Pranveer Singh Institute of Technology ***7.5 CGPA***

- **Coursework:** Data Structures, Algorithms, Database Management, Software Engineering, Distributed Systems, Computer Networks, Object-Oriented Programming, System Design.

EXPERIENCE

Software Development Engineer | AdNabu **Sep 2024 – Present**

Django, Python, React, Celery, PostgreSQL, Docker, GCP, pytest, Redis, RabbitMQ, Claude Code

- Optimized product synchronization pipelines using bulk database operations and batched processing, **reducing execution time from 2.3 minutes to 15–30 seconds** while eliminating 300K+ database operations.
- Reduced Celery worker memory usage by ∼**68%** through chunked task execution and optimized batch processing, improving background job stability.
- Re-architected Redirect Manager queries for stores with 68K+ redirects, reducing API response time **from 60+ seconds to 2–5 seconds** through PostgreSQL query optimization.
- Resolved critical onboarding and synchronization issues across Shopify webhooks, Celery, and backend services, **eliminating** product import **delays of up to 58 minutes** for new merchants.
- Improved analytics API performance by parallelizing workloads and optimizing database access, **reducing P95 latency** from 3.7 seconds toward the sub-2 second target.
- Consolidated ∼**98 cloud secrets** into **10–11 logical configurations (**∼**89% reduction)** and enhanced CI/CD workflows, simplifying deployments and improving infrastructure maintainability.
- Diagnosed and resolved critical production incidents including Google Content API failures, Sentry errors, and database performance bottlenecks, contributing to **100%** service uptime through on-call ownership and hotfix **deployments**.

Software Developer Intern | Cognitree **May 2024 – July 2024**

Flask, SQLite, REST, Python, Linux, GitHub ***Certificate***

- Built a modular, stateless Python framework for efficient file processing and customizable report generation using argparse and tqdm.
- Developed a scalable Flask microservice for contacts management with SQLite and SQLAlchemy, supporting REST APIs with sorting, filtering, and pagination.
- Configured deployment using Gunicorn on Linux, with CLI tools and Git, ensuring robust performance and smooth integration.

SKILLS / ACHIEVEMENTS

AI/GenAI : LLM API Integrations, Prompt Engineering, RAG, AI Agents, Tool Calling
Languages : Python, JavaScript, C++
Frameworks : Django, FastAPI, Flask, Node.js, Express.js, React.js
Concepts : Data Structures & Algorithms, Web Services, REST APIs, Microservices, Design Patterns
Databases : MongoDB, MySQL, SQLite, PostgreSQL
Developer Tools : Git & GitHub, Postman, VS Code, Linux
Cloud Technologies : Google Cloud Platform, Sliplane, SonarQube, Docker
3-Star, **Top 14.37%** and **1677** Rating on **LeetCode** *LeetCode*
Solved 1000+ problems across various platforms namely **LeetCode, HackerRank, CodeChef and GFG**.
Successfully completed **Open Source Contribution** in Hacktoberfest *LinkedIn*
Soft Skills : Excellent communication and collaboration, Analytical thinking and problem-solving

PROJECTS

In-House Localization & Translation Platform **July 2025 – Sep 2025**

Django, DRF, PostgreSQL, OpenAI, Google Cloud Storage, GitHub, Docker, Cloud Run

- Built a replacement for Localazy that relied on Django, DRF, PostgreSQL, and Celery and functionalities such as integrating GPT-4o, REST APIs, and admin tools. Designed and deployed it single-handedly, saving about 600,000 rupees (around 7000 dollars) annually.
- Improved translation by correcting LLM-generated translations that broke complicating variables or plural forms, introducing placeholder restoration, three-level context inheritance, as well as adding validation for plural forms, key paths, and correct spellings. Achieved 100% translation accuracy without manual corrections.
- Minimized the number of calls to the OpenAI API and rate-limit failures by batching multi-key requests, estimating tokens before making calls, and implementing an exponential back-off in case of rate-limit errors.
- Published locales through GCS CDN and GitHub Actions in an automated manner that did not have to go through the manual publishing stage and could be triggered only by source-string changes. Fixed a serious SSRF vulnerability through URL validation.
